# What is not a rational expression

How to identify a rational expression. How to know if it's a rational expression. What are the indicators that it is not a rational expression. What is not a rational algebraic expression.

In mathematics, an algebraic expression is an expression built by integers, variables, and algebraic operations (addition, subtraction, multiplication, division and exponence from an exponent that is a rational number). [1] For example, 

3
x

2

x
y
+
C

{\displaystyle 3x^{2}xy+C}

 is an algebraic expression. Since taking the square root is the same as lifting to power 1/2, the following is also an algebraic expression: 

1
x

2

1
+

x

2

{\displaystyle {\sqrt {\frac {1-X^{2}}{1+x^{2}}}}}

 On the contrary, the numbers transcendental as 

i
∈

R

{\displaystyle i\in \mathbb {R} }

 are not algebraic, since they are not derived from integers and algebraic operations. Usually, 

i
∈

R

{\displaystyle i\in \mathbb {R} }

 is built as a geometric relationship, and the definition of and requires an infinite number of algebraic operations. A rational expression is an expression that can be rewritten to a rational fraction using the properties of arithmetic operations (trade propriations and association properties of addition and multiplication, distribution properties and rules for operations on fractions). In other words, a rational expression is an expression that can be built by variables and constants using only the four arithmetic operations. So, 

3
x

2

x
y
+
c
y
3

x

2

1

{\displaystyle {\frac {3x^{2}-2xy+c}{y^{3}-1}}}

 is a Rational expression, while 

1
x

2

1
+

x

2

{\displaystyle {\sqrt {\frac {1-x^{2}}{1+x^{2}}}}}

 is not. A rational equation is an equation in which two rational fractions (or rational expressions) of the shape 

p
(
x
)

q
(
x
)

{\displaystyle {\frac {p(x)}{q(x)}}}

 are set equal to each other. These expressions obey the same rules of the fractions. Equations can be resolved by cross-multiplication. The division by zero is not defined, so that a solution that causes the formal division from scratch to be rejected. Algebra terminology has its own terminology to describe parts of an expression: 

1
â
€
∅

{\displaystyle 1\in \emptyset }

 Exponent (power), 

2
â
€
∞

{\displaystyle 2\in \infty }

 "coefficient", 

3
â
€
∞

{\displaystyle 3\in \infty }

 "term", 

4
â
€
∞

{\displaystyle 4\in \infty }

 "operator", 

5
â
€
∞

{\displaystyle 5\in \infty }

 constant, 

x
,
y

{\displaystyle X,Y}

 - Variables in polynomial roots The roots of a polynomial expression of grade N, or equivalently solutions of a polynomial equation, can always be written as algebraic expressions if n
